

Household Energy, Black Carbon, Climate, and Health

Kirk R. Smith

Professor of Global Environmental Health
University of California, Berkeley

2009 International Workshop on
Black Carbon in Latin America

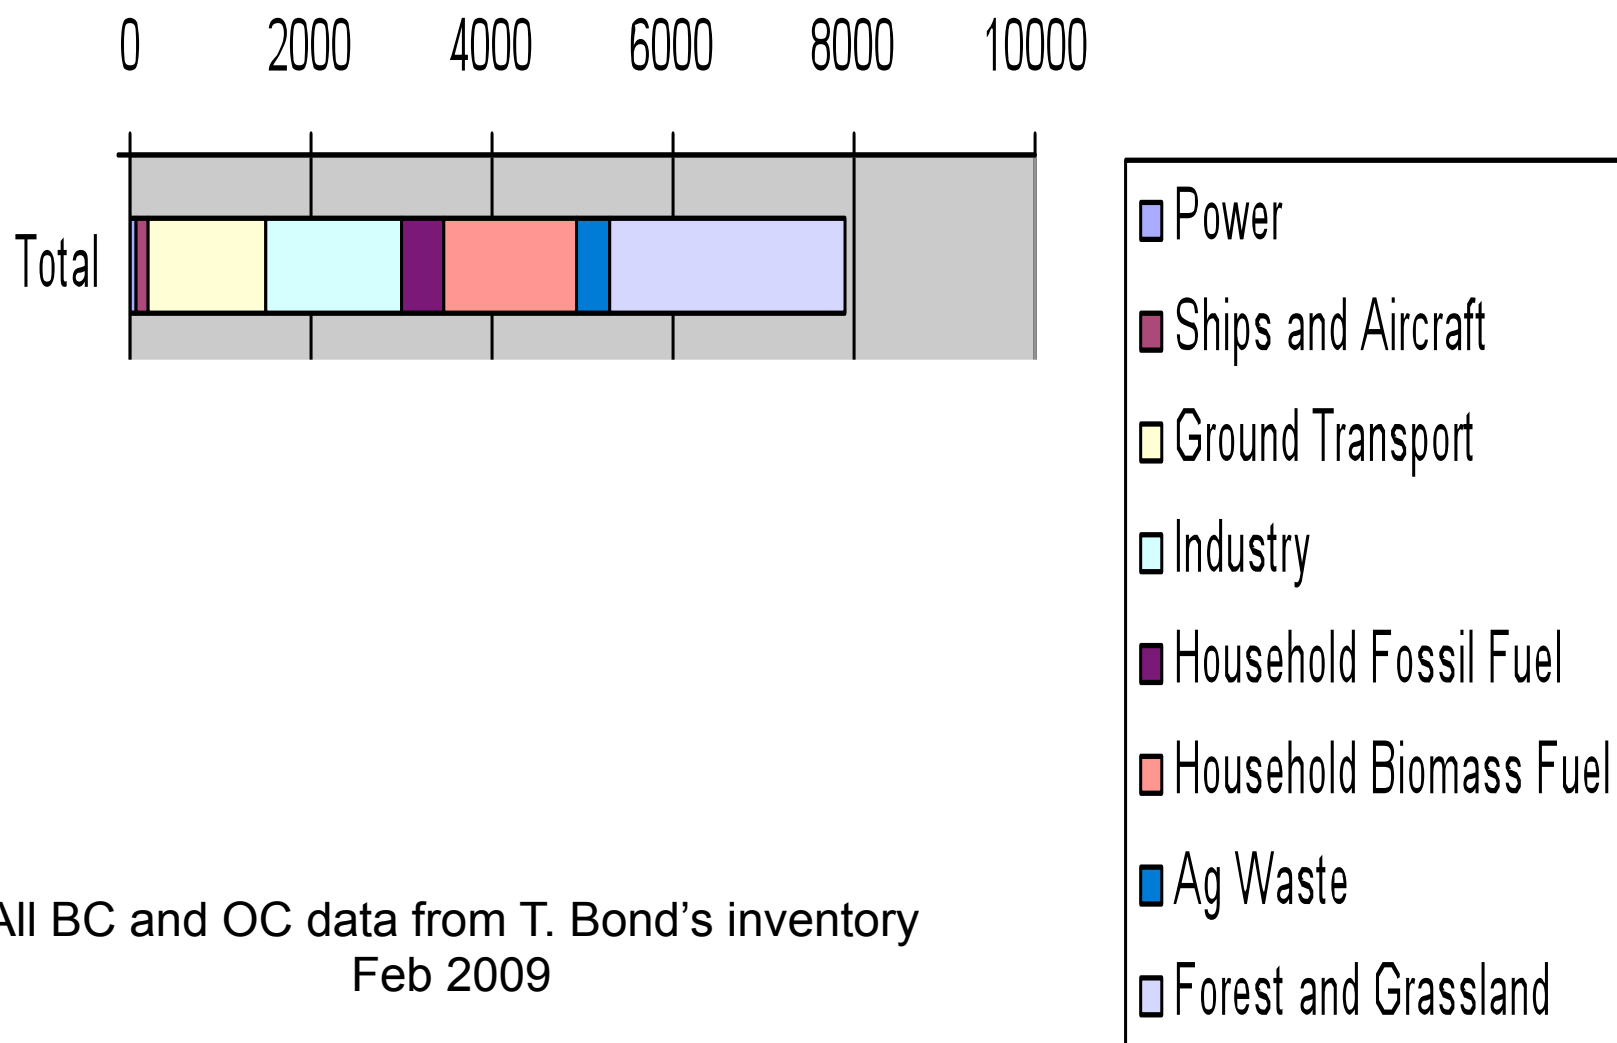

International Council on Clean Transportation, Instituto
National de Ecologia, Centro Mario Molina

Mexico City, Oct 19, 2009

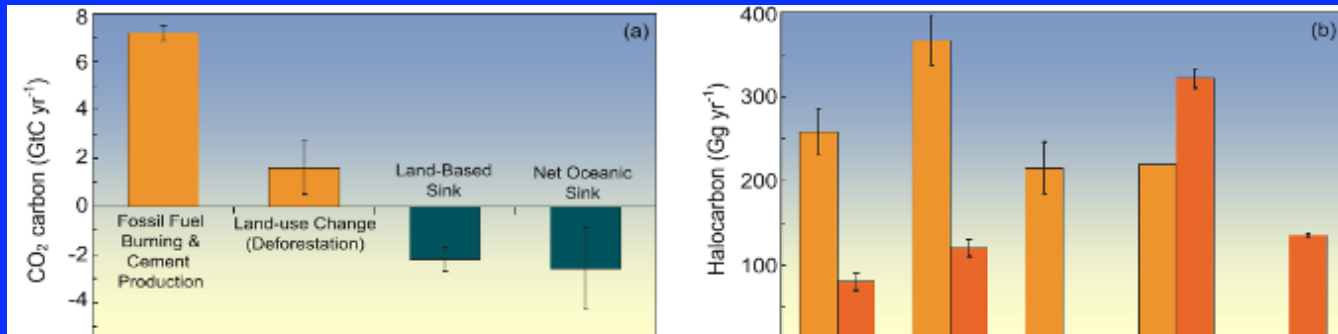

Road Map

- BC inventories for household fuel: framing issues
- Household fuel's health impacts: pneumonia in children
- What interventions are needed for health and climate?

Black Carbon Emissions

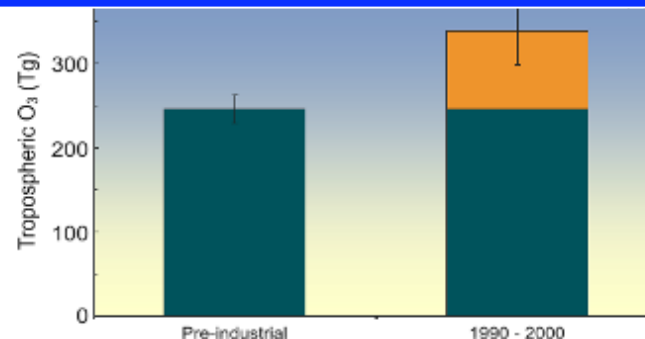

All BC and OC data from T. Bond's inventory
Feb 2009

Inventories for CO₂, CH₄, and N₂O

Carefully parsed into “natural and “human-caused”
as well as “pre-industrial and post-industrial”

Not done yet for BC, OC, and Sulfate.

Total Black Carbon Emissions in 2000

Source: T Bond Database, V 7.1.1 Feb 2009
Plus Bond et al., 2004

One-third of methane emissions from natural sources
– not put into anthropogenic group by IPCC

In CO₂ Inventories: rest is considered non-controllable or?

Controllable Black Carbon Emissions in 2000

Source: T Bond Database, V 7.1.1 Feb 2009

Total: 5300
gigagrams

Pre-industrial
but perhaps
increased
since

Unequivocally
Post-1750

~36% of total BC

~57% of
controllable

No forest
or grass fires

Black Carbon Emissions

Really four categories

- Natural – not amenable to human interventions (e.g., some wildfires)
- Pre-industrial but amenable to human interventions (e.g. household biomass fuel burning)
- Post-industrial (e.g., essentially all fossil fuel use)
- Net of the cooling from organic carbon particles

Components of radiative forcing for principal emissions

Intimately linked:
Generally
not possible to control
one without the other

PPM CO₂-equivalent in 2005 beyond pre-industrial levels

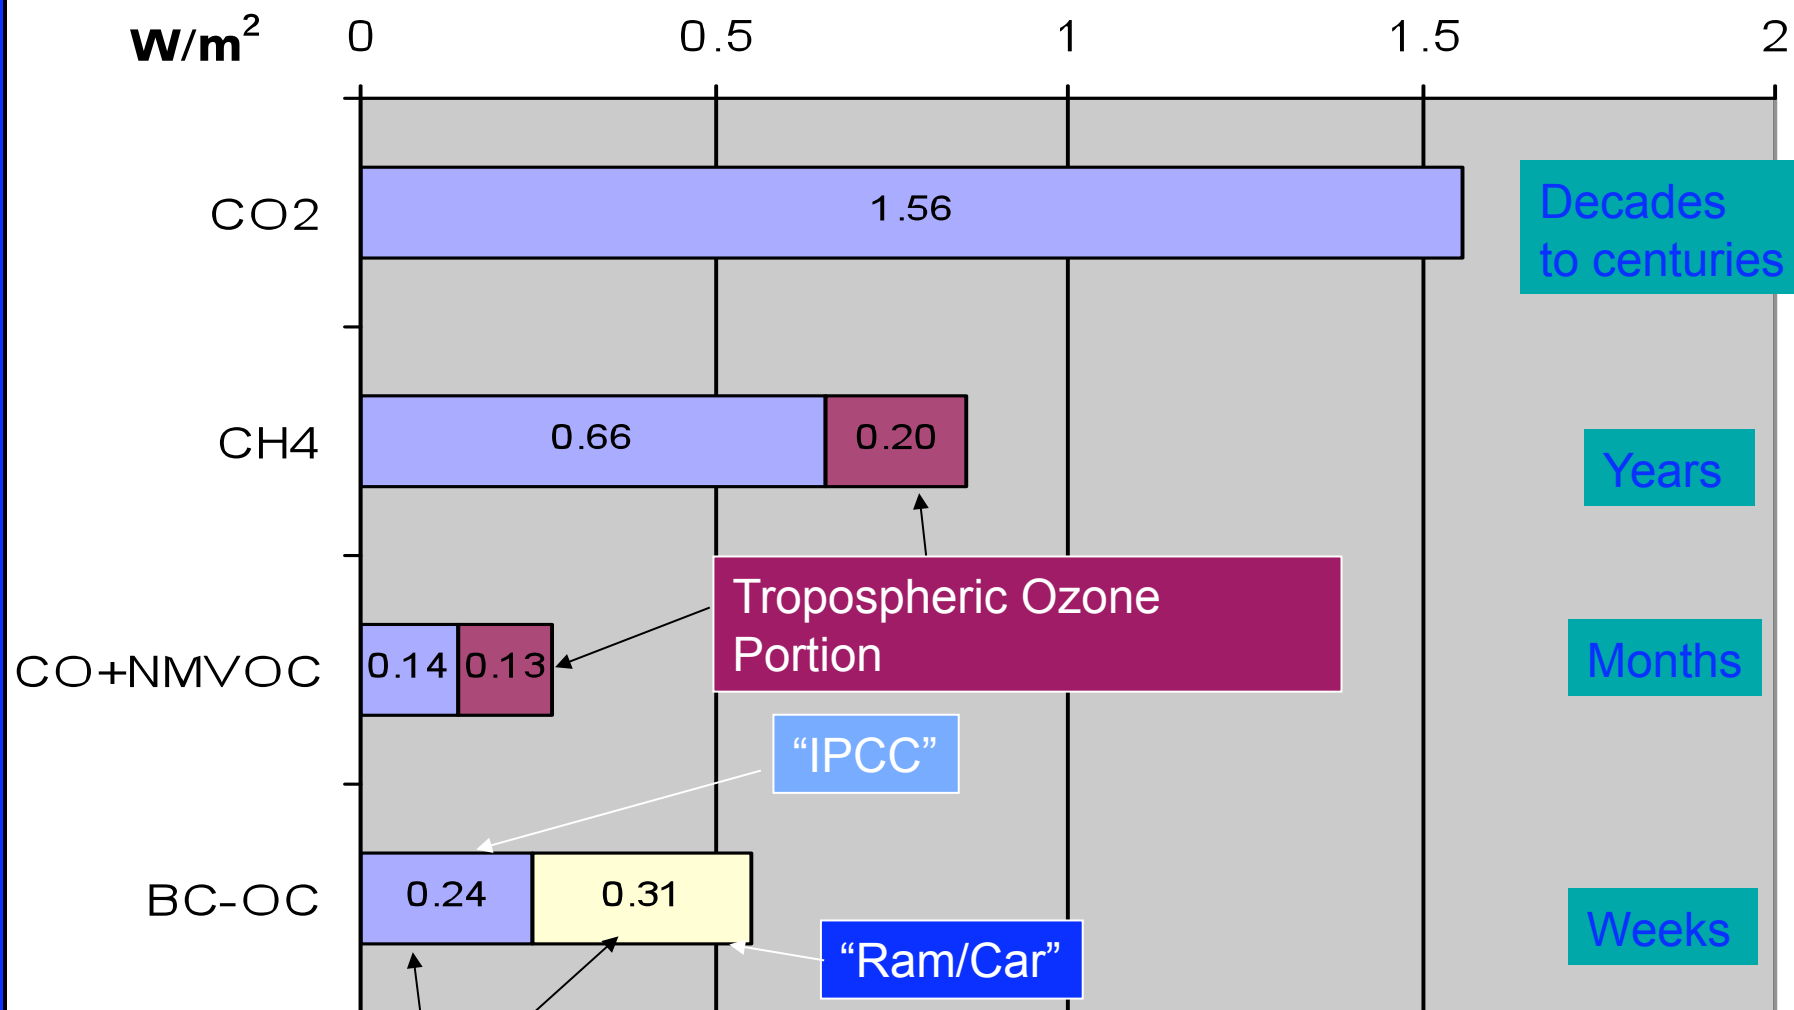

Total in 2005
(IPCC forcing).

Equivalent to
471 ppm CO₂

(on top of CO₂
background ~270 ppm)

Recommended Accounting

Controllable PIC Emissions Plus CO₂ Radiation Forcing in 2005

**Warming in 2005
from emissions
since 1750**

The climate change problem is caused not only by too much complete combustion of fossil fuels (CO₂), but also by too much incomplete combustion of all fuels (PIC)

IPCC, 2007

Combustion Particles: The Oldest Pollutant

- Oldest: first measured and regulated
 - First Royal Air Pollution Commission in history
 - Appointed in 1265, completed its report in 1306
 - (setting the standard for expert committees)
 - Recommended banning coal burning in London
 - Duly taken up 650 years later by the authorities (1956)
 - (setting the standard for policy response)
 - First systematic measurements in London in 1800s:
on fire stations
 - First exposure response relationships for air pollutants

Combustion PM: The Newest Pollutant

- mechanisms of creation and impact are still not clear,
- effects of separate constituents, e.g., black carbon, still uncertain
- new health standards being implemented,
- new measurement methods being developed,
- even basic metrics in some doubt
- major impacts on regional and global climate now recognized
- difficult tradeoffs now discussed between climate and health goals

Energy flows in well-operating traditional woodfired cookstove

A Toxic Waste Factory!!

Typical biomass cookstoves convert 6-20% of the fuel carbon to toxic substances

Smith et al., 2000

Toxic Pollutants in Biomass Fuel Smoke from Simple (poor) Combustion

- Small particles. Includes 3-10% BC
- Hydrocarbons
 - 25+ saturated hydrocarbons such as *n-hexane*
 - 40+ unsaturated hydrocarbons such as *1,3 butadiene*
 - 28+ mono-aromatics such as *benzene & styrene*
 - 20+ polycyclic aromatics such as *benzo(~~X~~)pyrene*
- Oxygenated organics
 - 20+ aldehydes including *formaldehyde & acrolein*
 - 25+ alcohols and acids such as *methanol*
 - 33+ phenols such as *catechol & cresol*
 - Many quinones such as *hydroquinone*
 - Semi-quinone-type and other radicals
- Chlorinated organics such as *methylene chloride* and *dioxin*

Naeher et al.
2007, JIT

Size Distribution of Biomass Smoke Particles

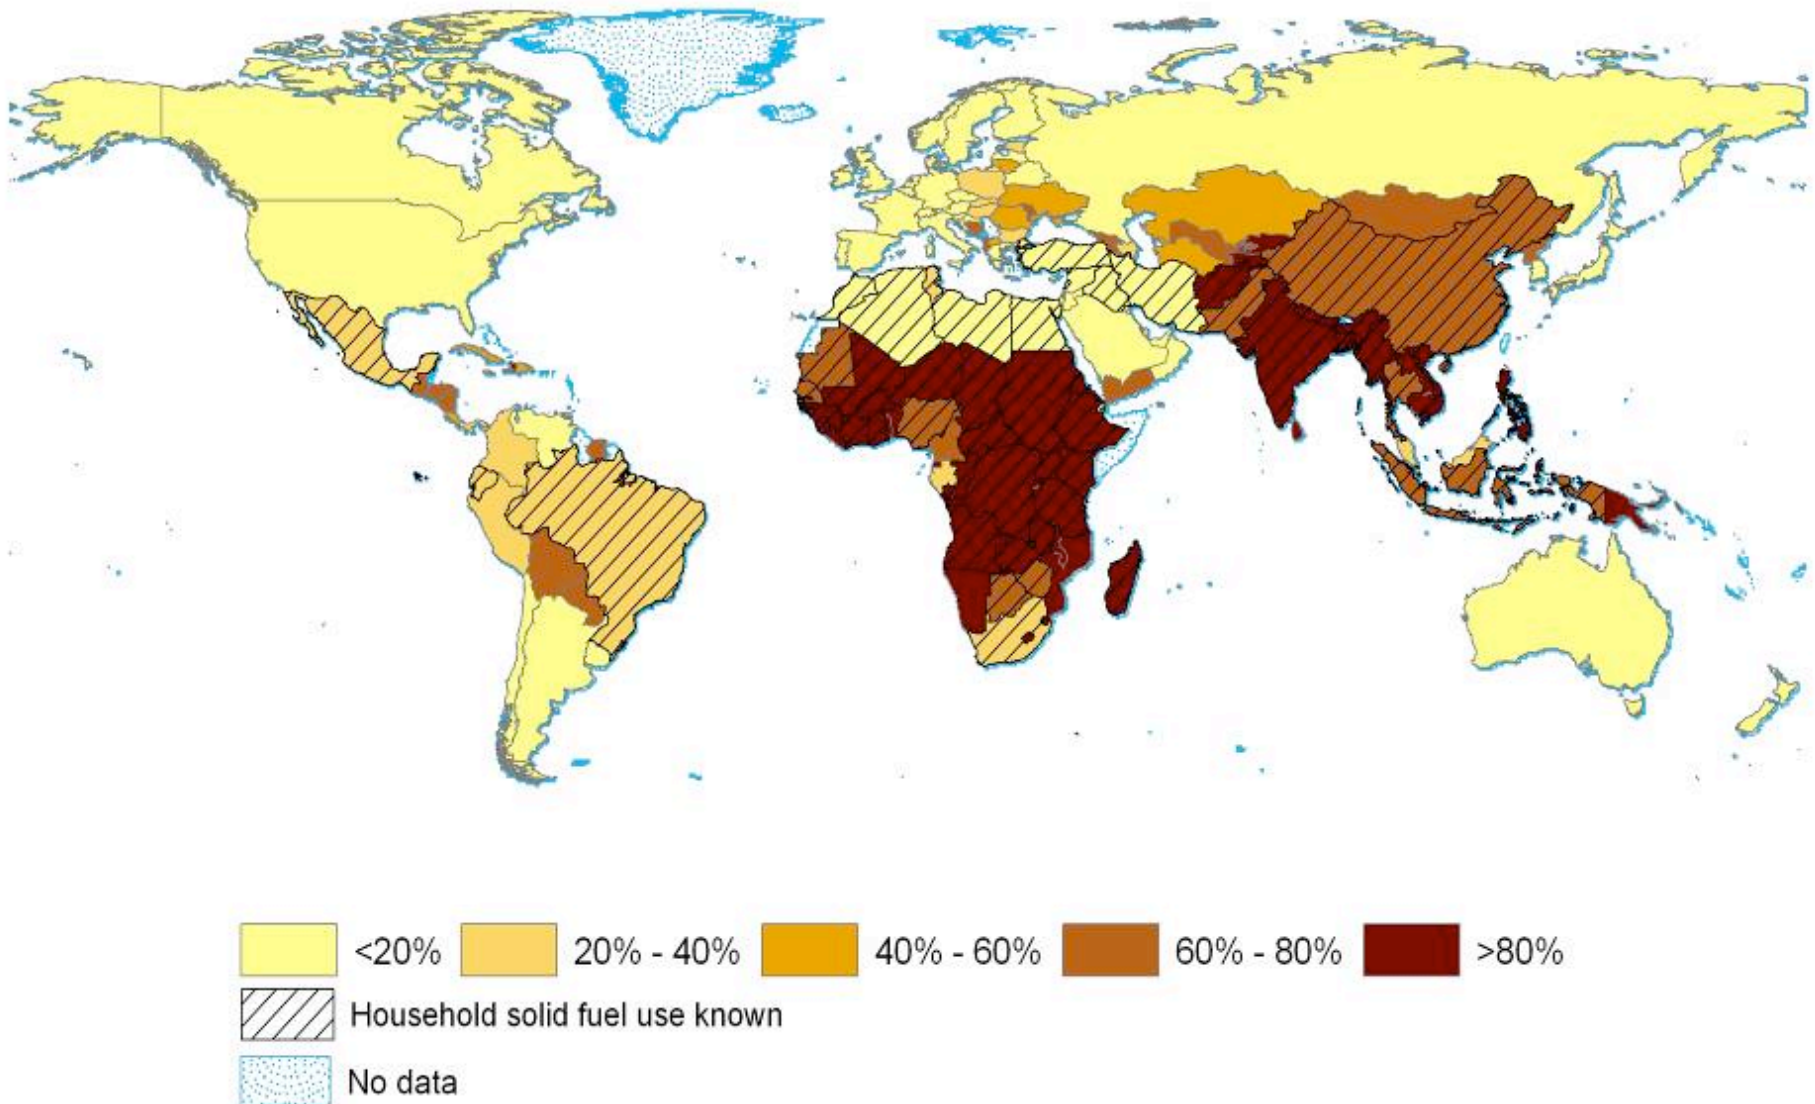

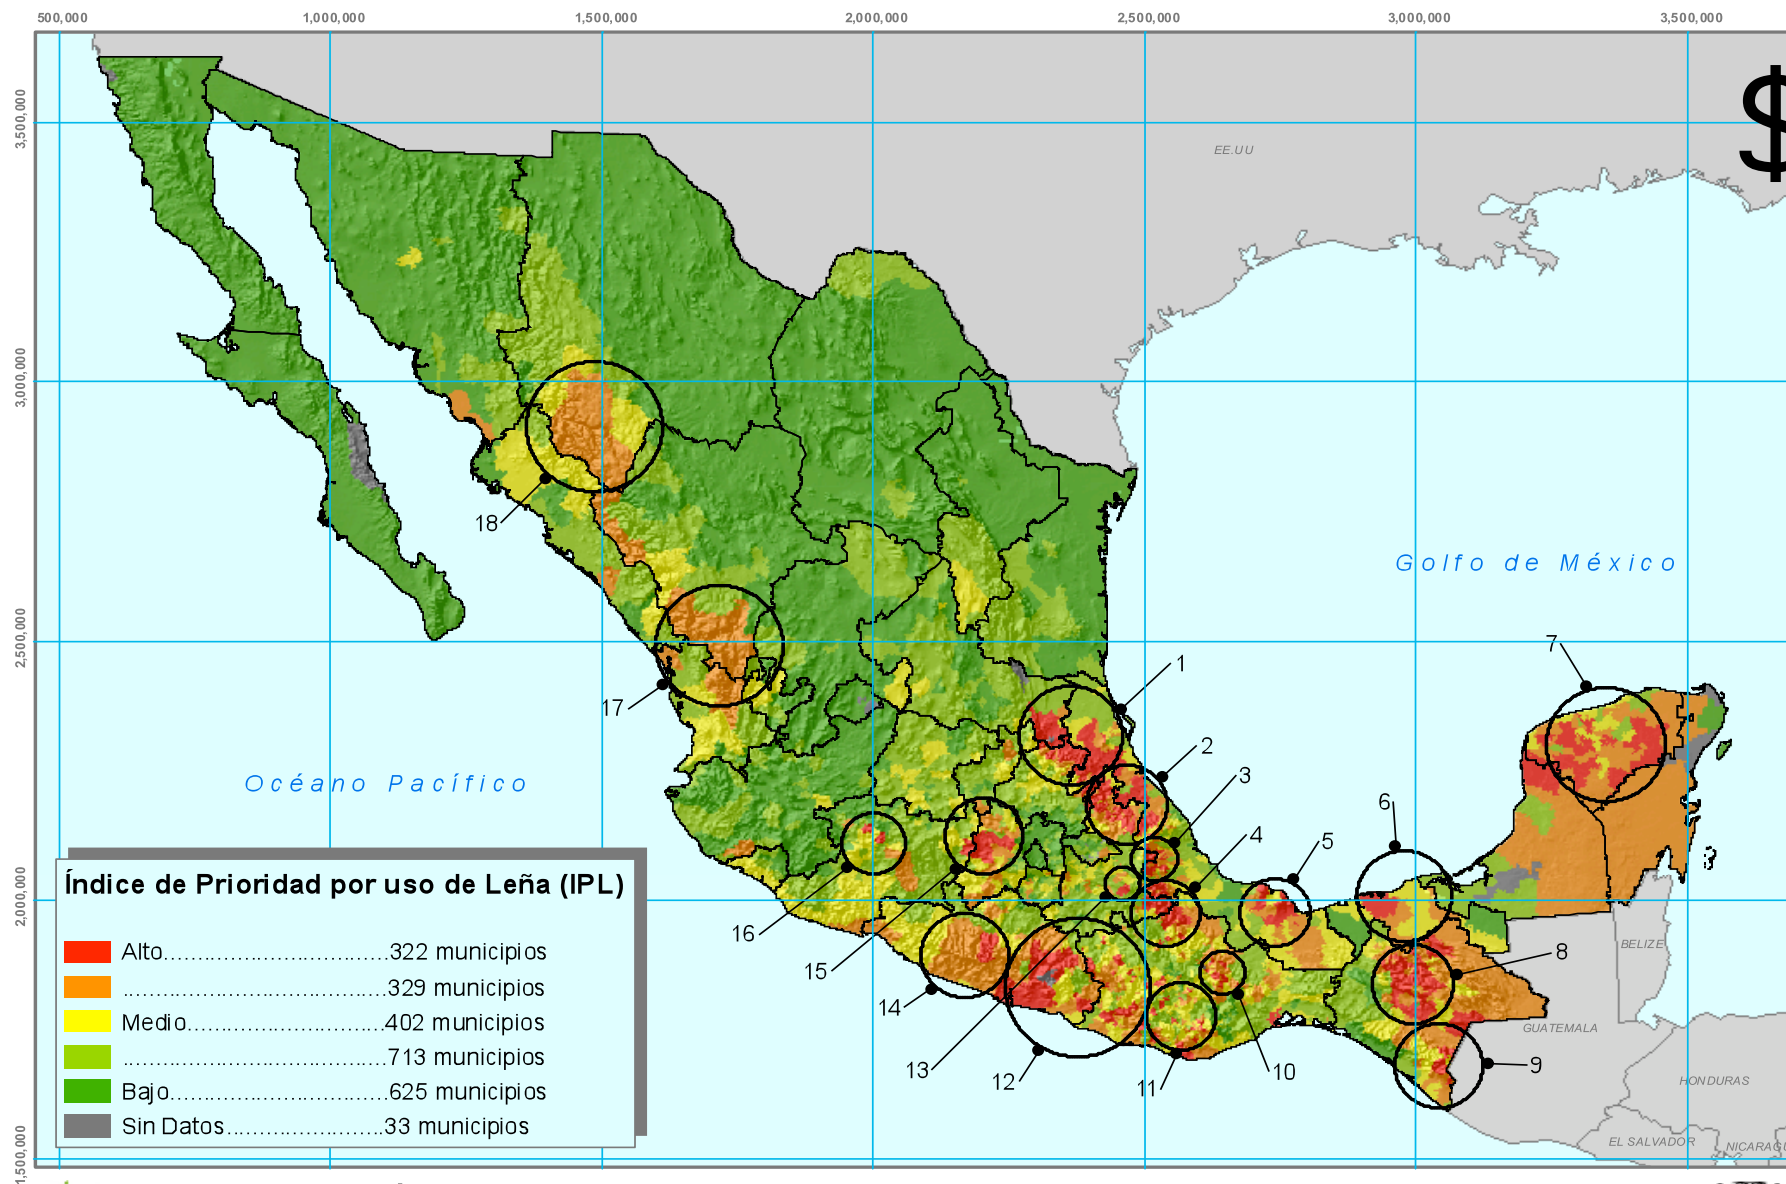

Figure 2.2. Size distribution of woodsmoke and dungsmoke particles. Measurements taken in the East-West Center simulated village house as reported in Smith *et al.* (1984b). (Figure prepared by Premlata Menon.)

trachoma)

Tuberculosis

Heart disease

Pneumonia from acute lower respiratory infections (ALRI)

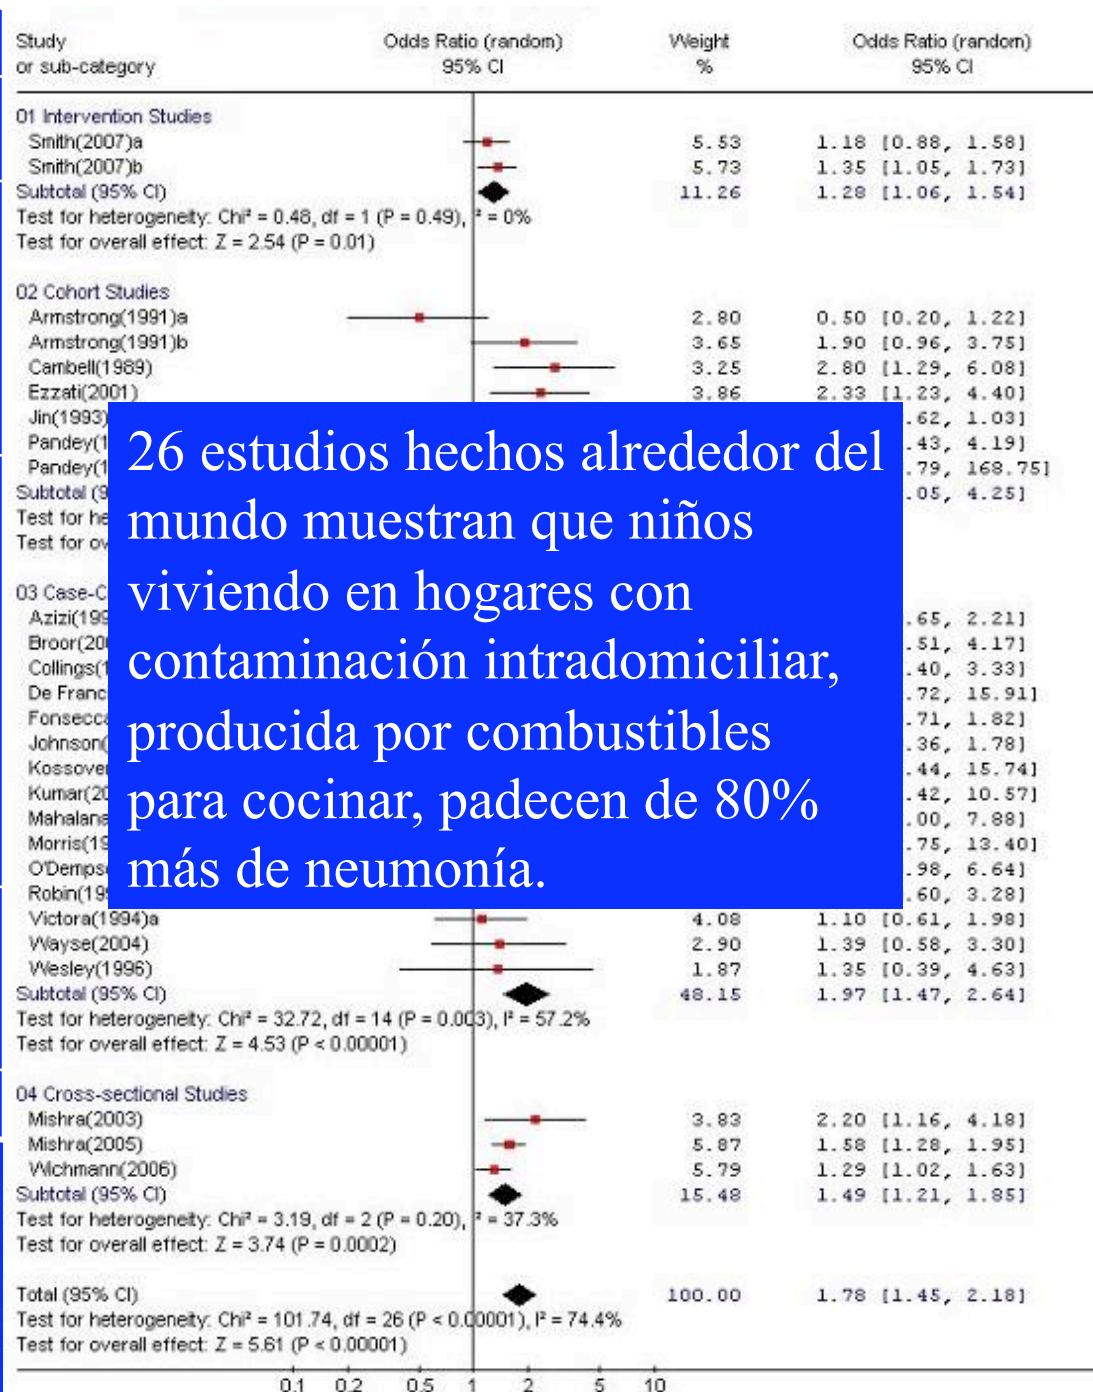

Chief cause of death among the world's children (~2 million per year). Thus, it is the chief global cause of lost healthy life years.

Well-accepted risk factors (malnutrition, micro-nutrient deficiencies, other diseases, crowding, chilling) do not account for its scale.

Tip de Estudio	N*	OR	95% IC
Intervención	2	1.28	1.06, 1.54
Cohorte	7	2.12	1.06, 4.25

Traditional 3-stone open fire

Plancha chimney wood stove

Effect of Plancha on PM2.5

Log Scale

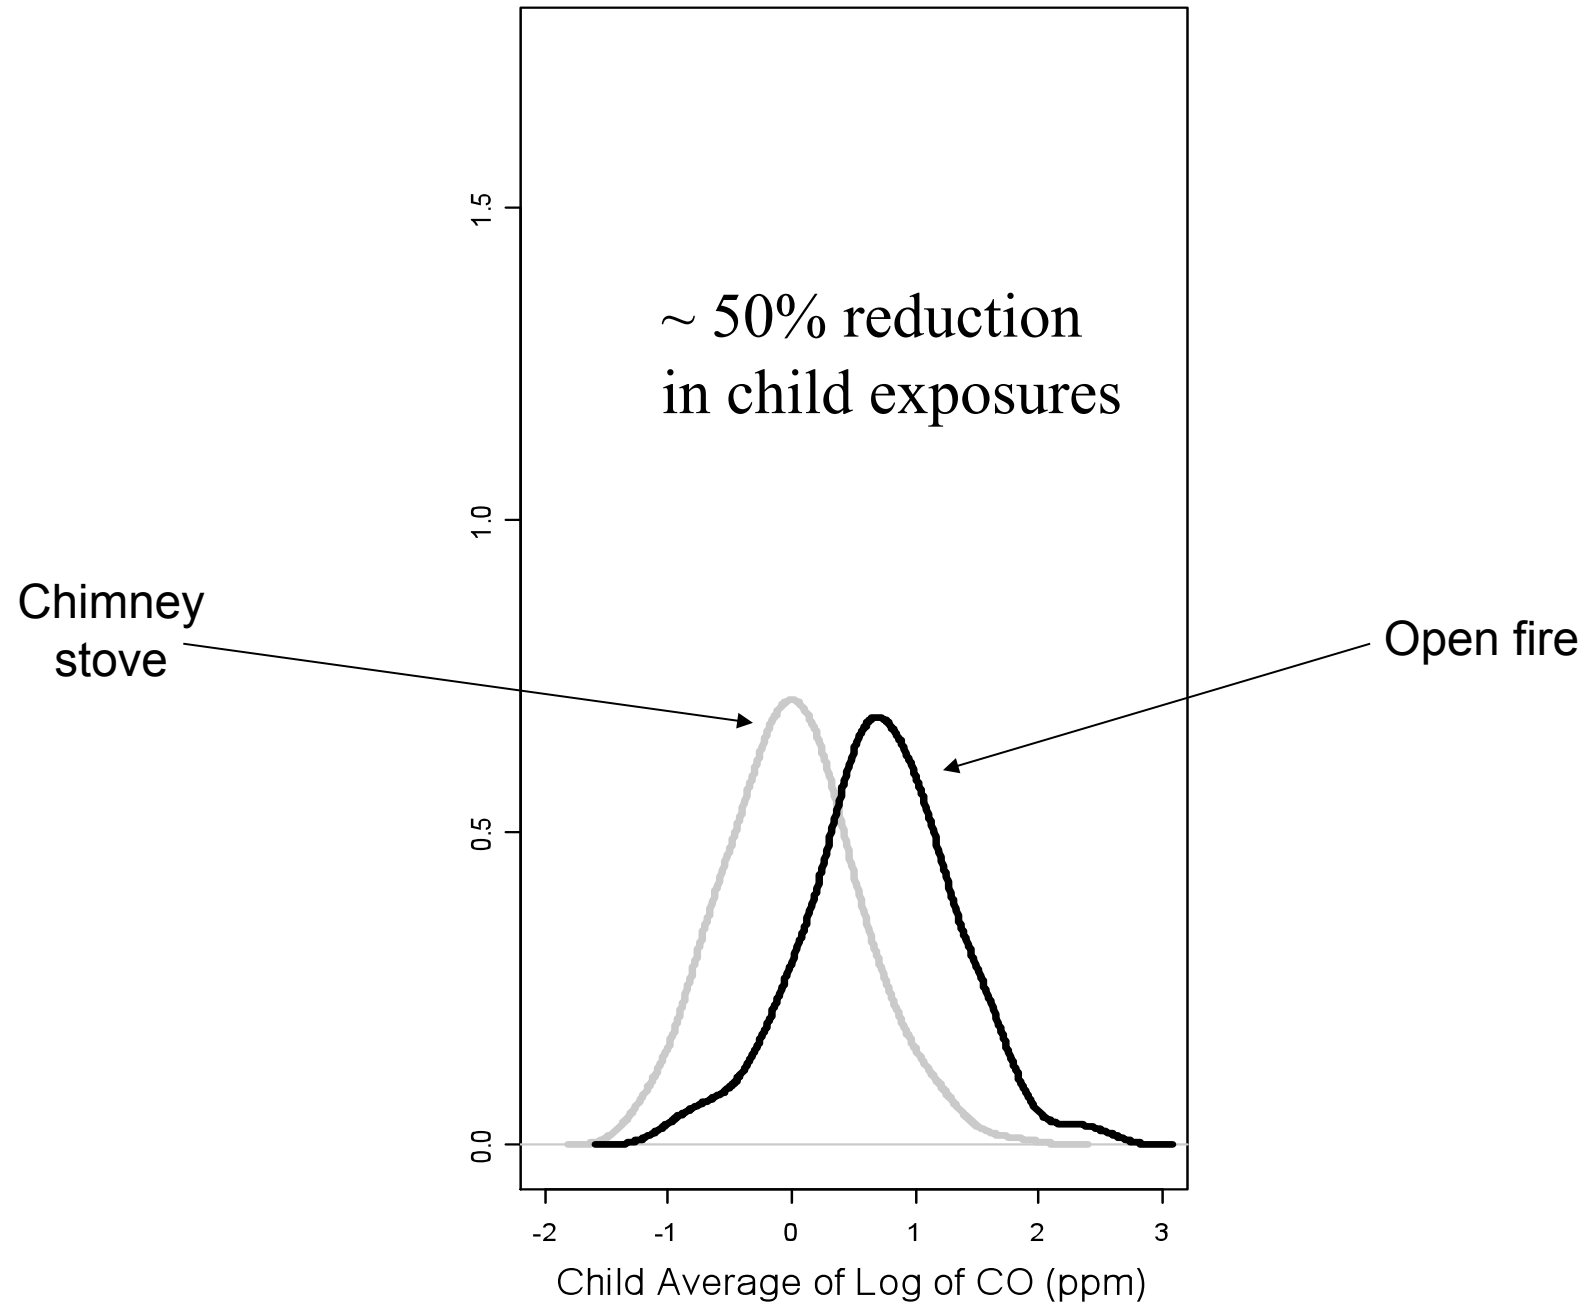

Tubito

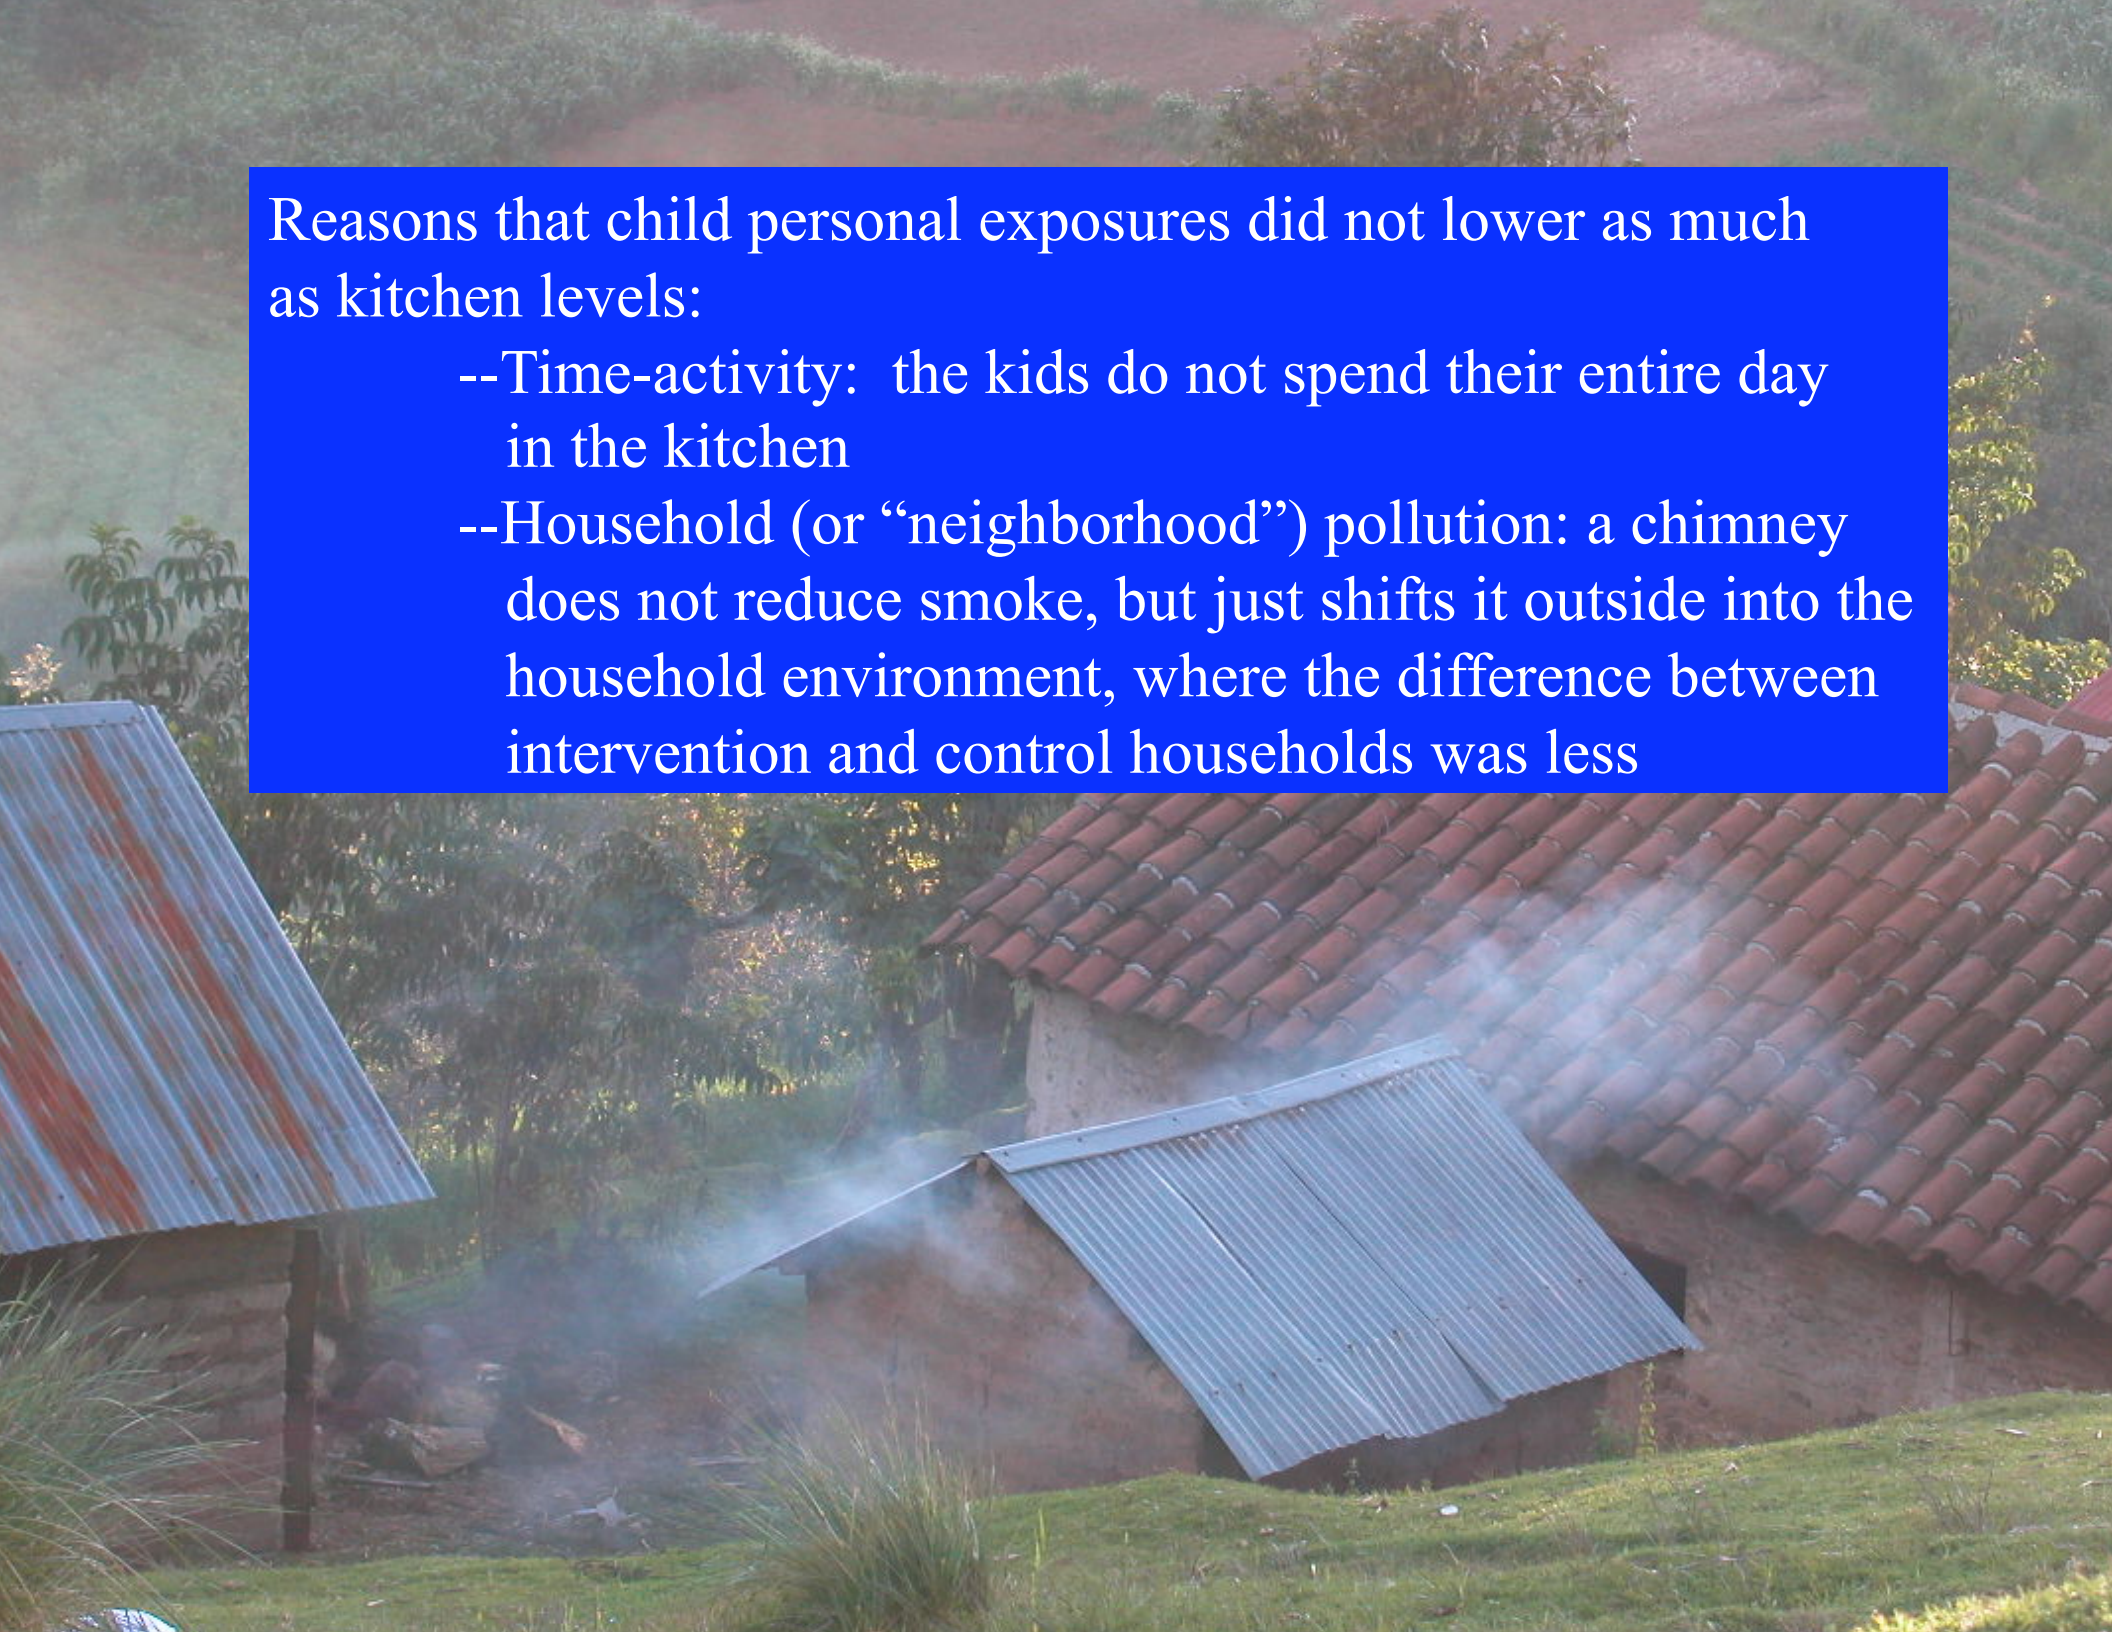

Tubito

(b)

Reasons that child personal exposures did not lower as much as kitchen levels:

- Time-activity: the kids do not spend their entire day in the kitchen
- Household (or “neighborhood”) pollution: a chimney does not reduce smoke, but just shifts it outside into the household environment, where the difference between intervention and control households was less

Effect of Plancha on PM2.5
