1 INTRODUCTION

The 2022/23 edition of *European Vehicle Market Statistics* offers a statistical portrait of passenger car, light commercial, and heavy-duty vehicle fleets in the European Union (EU) from 2001 to 2021. As in previous editions, the emphasis is on vehicle technologies, fuel consumption, and emissions of greenhouse gases and other air pollutants.

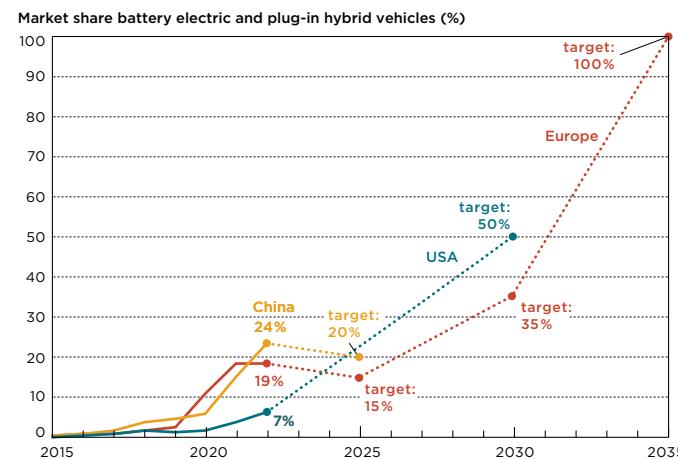

The following pages give a concise overview of data in subsequent chapters and summarize the latest regulatory developments in the EU. More comprehensive tables are included in the annex, along with information on sources.

Number of vehicles

2021 was characterized by a continued drop in total new car registrations in the EU across all markets, stemming from the outbreak of the COVID-19 pandemic in early 2020. About 9.7 million new cars were registered in the 27 Member States of the EU in 2021, about 3% less than the previous year and 26% less than the market peak in 2019. Vehicle sales stagnated in nearly all segments, with two exceptions: the sport utility vehicle (SUV) segment, where sales rose nearly 8% compared to 2020, and the van segment, where registrations dropped 44% compared to 2020. The SUV segment thus continued to consolidate its position as market leader, making up 43% of new registrations in 2021, followed by the Lower Medium segment (20%).

New registrations of plug-in hybrid and battery electric passenger cars in the EU have also soared in recent years, jumping from about 3% in 2019 to 19% of total registrations in 2021, already exceeding the EU target for 2025 (**Fig. 1-1**). This jump can be primarily attributed to the mandatory CO₂ emissions target of 95 grams per kilometer (g/km) which took effect in 2020, as well as national and local policies. However,

the market share has stagnated in the first six months of 2022, in part due to lapsing government subsidies and ongoing supply shortages. China's electric vehicle market started to take off shortly after the EU and has since surpassed the EU market share, climbing to 24% by mid-2022, up from just 5% in 2019. The trend in China has been primarily driven by national pilot programs, incentives, and regulations, in particular the new energy vehicle (NEV) mandate for car manufacturers. In contrast, the market in the United States is still warming up to electric vehicles. With an ambitious target of 50% by 2030, the U.S. market share still has a long way to go. However, the region notably exhibited the highest growth rate in the first half of 2022, reaching 7%, three times higher than in 2020, supported by recent progress on charging infrastructure and tax credits for EV purchases (Mock & Yang, 2022).

Data for China and the United States is taken from Marklines. Data for Europe is taken from the European Environmental Agency (EEA) and Dataforce. Data for China and Europe only includes passenger cars, while data for the United States also includes light trucks.

Fig. 1-1

Historic development of the share of battery electric and plug-in hybrid vehicle models among all new vehicle registrations, as well as future targets, for China, Europe, and the United States

<https://t1p.de/q8cqk>

Fuel consumption and CO₂ emissions

The official level of average CO₂ emissions from new passenger cars registered in the European Economic Area, as measured in the laboratory via the Worldwide Harmonized Light Vehicles Test Procedure (WLTP), decreased to 115 g/km in 2021, which is approximately 16 g/km lower than in 2020 (Tietge et al., 2022). From 2021 onward, compliance with CO₂ emission targets will be measured using the WLTP test procedure, which became mandatory for new vehicles in September 2018.

After 2015 targets were met, and in the absence of targets before 2020, average CO₂ emissions increased up to 2019 by 0.7 g/km per year. With the introduction of the fleet-average NEDC CO₂ target of 95 g/km in 2020, new car emission levels fell at the unprecedent rate of more than 1 g/km per month. According to preliminary data published by the European Environment Agency (EEA), all manufacturers complied with their respective 2021 CO₂ targets, with only two manufacturers utilizing flexible compliance mechanisms such as super-credits and phase-in provisions to do so. Including these mechanisms lowered average WLTP CO₂ emission levels to 113 g/km.

New mandatory CO₂ standards for the years 2025 and 2030 were adopted in early 2019 (Mock, 2019). For passenger cars and vans, fleet-average emission reduction targets relative to a 2021 baseline were set at -15% by 2025. The targets for 2030 are -37.5% for cars and -31% for vans. For heavy-duty vehicles (HDVs), currently adopted CO₂ emissions targets are -15% by 2025 and -30% by 2030, relative to a 2019 baseline (Rodríguez, 2019).

In October 2022, the European Commission, the European Parliament and the EU Member States agreed on strengthening the post-2020 CO₂ standards for new passenger cars and vans. It agreed to raise

the 2030 target to -55% for new passenger cars and -50% for new vans, relative to a 2021 baseline, and -100% by 2035 for both cars and vans. The agreement, expected to be adopted by early-2023, is part of the Commission's "Fit for 55" regulatory package, which, among other actions, aims to bring road transport CO₂ targets in line with the EU's ambition to cut greenhouse gas emissions by at least 55% by 2030 compared to 1990 levels (Dornoff et al., 2021). A review of heavy-duty CO₂ standards is also currently underway.

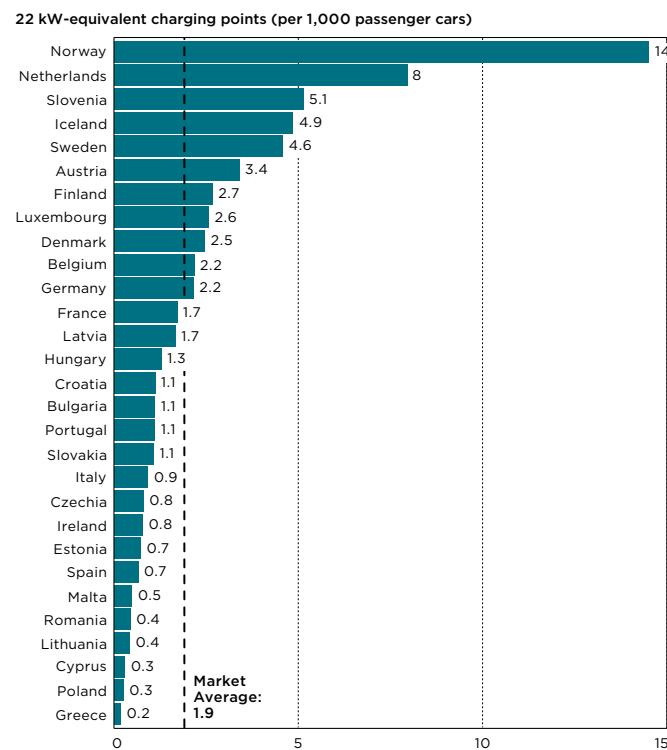

Technologies and key technical parameters

Although the vast majority of Europe's new cars continue to be powered by gasoline or diesel engines, the share of alternatives is steadily increasing. Battery electric vehicles (BEVs) and plug-in hybrid vehicles (PHEVs) each accounted for 9% of all new car sales in 2021, while hybrid electric vehicles (HEVs) made up about 7% of the market. HEVs were most popular in Finland, where the market share increased to 15% in 2021. Toyota continues to dominate the market for HEVs in Europe, with about 71% of all new Toyota vehicles in 2021 being hybrid electric.

Top EU markets for BEVs in 2021 were the Netherlands, where 20% of new car sales were battery electric, followed by Sweden with a BEV share of over 19%, up from just 10% in 2020. Sweden was also the leading market for PHEVs, where they made up 26% of new sales. Outside the EU, sales of electric vehicles were particularly high in Norway, where 65% were BEVs, 22% were PHEVs. The success of electric vehicles in Norway and the Netherlands can be partially attributed to the extensive charging infrastructure capacity in the countries. Norway reached 14.5 publicly accessible charging points per thousand passenger vehicles in 2021, over 7 times the EU market average, followed by the Netherlands with 8 charging points (**Fig. 1-2**).

Fig. 1-2

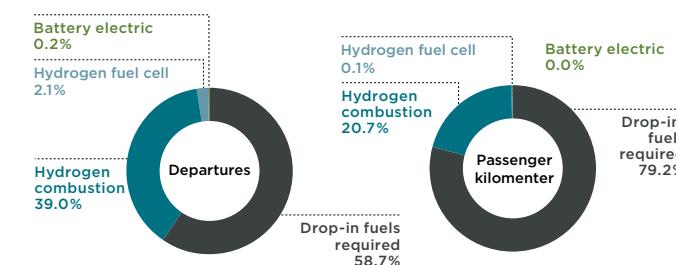

22 kW-equivalent publicly accessible recharging points installed per thousand passenger vehicles for every EU and EFTA country by the end of 2021

In terms of manufacturer brands, Volvo (39%) and Mercedes-Benz (27%) were among the top sellers of PHEVs in 2021. Renault and VW led in sales of BEV models, with 14% and 12%, respectively.

In 2021, the average mass of new cars in the EU increased to 1,481 kg, 17% above 2001 levels. The average mass of the Swedish new car fleet was, at 1,709 kg, well above the EU average and considerably above other relatively heavy EU fleets, such as in Germany where the average was 1,577 kg. This can likely be attributed to Sweden's high share of electric vehicles. In contrast, customers in Italy and France opted for significantly lighter cars, with an average weight of 1,369 kg and 1,393 kg, respectively. The average engine power was 102 kW in 2021, which is about 38% more than in 2001.

Looking at a different transportation sector, the potential for battery electric and hydrogen technologies is more restricted for the aviation industry. Just 0.2% of today's flights could utilize battery electric technologies, and when looking at total passenger kilometers this drops to next to zero. The same is found for hydrogen fuel cell technology, which could be implemented in 2.1% of flights but only 0.1% of total passenger kilometers. This can be attributed to the fact that such technologies are only practicable for short flights, between 200 and 800 km, depending on the propulsion technology. Electric aircraft are limited by the weight of the batteries while fuel cell aircraft are limited by the volume of hydrogen that can be carried. Both technologies are, however, more energy efficient than fossil-fueled aircraft and should be used wherever possible. More promising is the potential to substitute one fifth of passenger kilometers with hydrogen combustion technology, and up to 39% of total flights. Non-biomass synthetic fuels (SAFs) such as e-kerosene could help further reduce the carbon footprint of all other flights. (Mukhopadhyaya & Rutherford, 2022) (Mukhopadhyaya & Graver, 2022) (**Fig. 1-3**).

**Fig. 1-3**

Potential application of alternative technologies in the aviation sector

Other emissions and on-road

The Real Driving Emissions (RDE) test procedure was phased-in beginning in 2017 for new vehicle types and is required for all new vehicles as of September 2019. As part of RDE, conformity factors were introduced that regulate how much higher vehicle emissions are allowed to be during on-road testing than during laboratory testing. For nitrogen oxides (NO_x), these conformity factors were 2.1 for the initial phase starting in 2017 (Euro 6d-Temp standard) and 1.43 from 2020 onward (Euro 6d standard). As of January 2021, all new vehicle registrations must be Euro 6d compliant. The subsequent Euro 6e standard will take effect from September 2023 for new vehicle types and a year later for all newly registered vehicles. It is expected to reduce the NO_x conformity factor (CF) to 1.10. A proposal for the Euro 7 standard, which will likely be the last step before the phase-out of CO_2 -emitting vehicles, was published by the European Commission at the end of 2022. This standard will take effect in 2025 at the earliest.

Low-emission zones provide an additional opportunity to reduce harmful emissions in densely populated areas. For example, the transport sector is one of the biggest sources of air pollution in Warsaw, Poland. A remote-sensing analysis of the city's passenger car fleet as part of the TRUE initiative* found that despite only making up 17% of the total vehicles, pre-Euro 4 diesel and petrol cars together contributed 37% of NO_x emissions and 51% of particle matter (PM). Diesel Euro 4 and Euro 5 cars similarly produced 27% of NO_x and 28% of PM despite only comprising 13% of the total fleet. Restricting the use of vehicles certified to Euro 3 standard and below would have an immediate and substantial effect on Warsaw's air quality. The effectiveness of such low-emissions zones generally

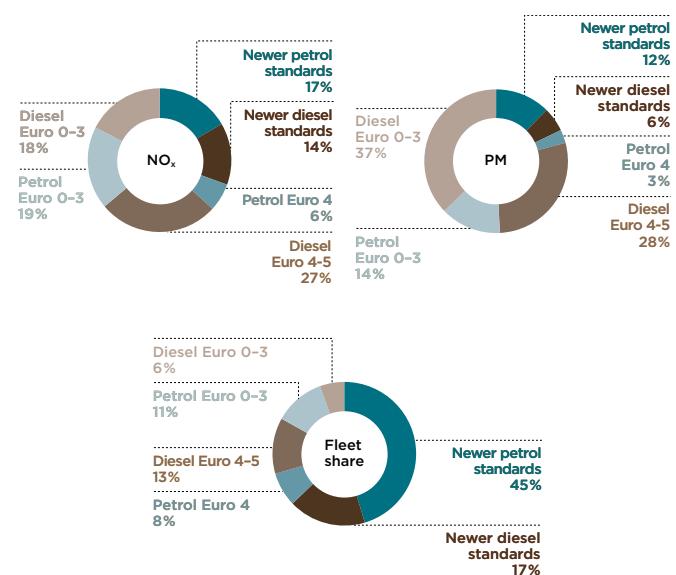

depends on their design and enforcement (Lee et al., 2022) (Fig. 1-4). Going one step further, European capitals including Copenhagen, Amsterdam and Paris are planning on implementing zero-emission or near-zero-emission zones within the next ten years (Wappelhorst & Cui, 2022).

The light-duty vehicle CO_2 regulation adopted in 2019 requires the European Commission to monitor the on-road fuel and electric energy consumption of passenger cars and vans to prevent growth in the gap between type-approval and real-world CO_2 emissions. Since 2021, to collect the necessary monitoring data, manufacturers are required to install on-board fuel and energy consumption monitoring devices (OBFCMs) in new vehicles. By 2023, the Commission must assess how OBFCM data may be used to ensure real-world CO_2 reductions and, by 2027, also assess the feasibility of adjusting each manufacturer's average CO_2 emissions to its real-world performance beginning in 2030 (Dornoff, 2019).

Fig. 1-4

Measurement share and estimated NO_x and PM emission shares from passenger cars measured in Warsaw in 2020 by fuel type and emission standard

2 NUMBER OF VEHICLES

2021 European new vehicle registrations

In 2021, every tenth new passenger car in Europe was already fully electric. Percentage-wise, the share of electric vehicles among new buses was higher than for new passenger cars. The total market for buses is only a fraction of the passenger car market size though. The van and especially the truck markets lag behind cars and buses when it comes to electrification. On a country-by-country basis, Norway stands out with the highest electric market share for passenger cars, Finland for buses.

Electric vehicles = battery electric and fuel cell electric vehicles;
geographic scope: European Economic Area (EEA) = European Union, plus Iceland, Liechtenstein, and Norway
Data sources: European Vehicle Manufacturer Association (ACEA), European Environmental Agency (EEA)

About 9.7 million new cars were registered in the EU in 2021. Registrations in Europe are dominated by the larger countries; the three largest alone – Germany, France, and Italy – accounted for 59% of the total (**Fig. 2-1**).

Germany is the largest vehicle market, currently with a 26% share of the total EU market. Registrations in Germany dropped between 2006 and 2008, and then reached an all-time high in 2009 thanks to a government scrappage scheme. After falling again in 2010, registrations gradually increased to around 3.6 million vehicles in 2019, a level comparable to that of 2009. By contrast, in Spain fewer than half as many new vehicles were registered in 2012 as in 2001–2007. In recent years, sales in Spain have trended sharply upward, reaching roughly 1.4 million in 2019. The outbreak of the Covid-19 in 2020 reversed the growth trend in both countries, and sales dipped by 20% in Germany and 32% in Spain compared to 2019 (**Fig. 2-2**).

In 2021, new car sales again fell across all vehicle segments in comparison to 2020. Also, with the UK leaving the EU, reported vehicle sales numbers are significantly lower than in previous years. Despite these developments, market shares by segment remained largely unchanged. The SUV segment kept its share at 39%, and the Mini segment also remained constant at 6%. About 4.6 million new cars in 2021 were SUVs, eight times as many as in 2001 (**Fig. 2-4**).

In 2021, the Renault Clio became the most popular car model in Europe, accounting for about 2.1% of all new vehicle sales. Long-time leader, the VW Golf, accounted for 1.8% of all new cars (**Fig. 2-10**).

New registrations of heavy trucks and buses in the EU amounted to 320 thousand in 2021 (**Fig. 2-12**). The truck market in the EU is dominated by only five manufacturers, together accounting for nearly 100% of all sales (**Fig. 2-15**).

by brand

While in reality many brands are part of a larger group (for example VW, Audi, Škoda, Seat and others are part of the Volkswagen Group), for this report, each of the brands are shown individually. The reason for this is that brand affiliations have changed in the past (as for example in the case of Daimler and Chrysler) and may change in the future.

CO₂ emissions (g/km)

100
50
0

CO₂ emissions according to New European Drive Cycle (NEDC);
Geographic scope: European Economic Area (EEA) = European Union, plus Iceland, Liechtenstein, and Norway

Data source: European Environmental Agency (EEA)

The number of new diesel cars decreased sharply, from 5.6 million in 2017 to 2.2 million in 2021. But also the number of new gasoline cars declined, from 6.2 million to 4.8 million. Especially the number of battery electric cars increased, from 0.1 million in 2017 to 0.9 million in 2021. In total though, the number of new car registrations in Europe in 2021 turned out to be about 20% lower than in 2017, to a large extent due to Brexit. Average CO₂ emission levels declined from 118 g/km in 2017 to 97 g/km in 2021, according to the NEDC measurement procedure.

Average CO₂ emissions of newly registered cars in the EU, normalized to the NEDC test cycle, were about 97 g/km in 2021. Expressed in WLTP-terms, the average CO₂ level was about 116 g/km (**Fig. 3-1**).

Emission levels vary widely among Member States, with Germany at a level of 95 g/km in NEDC-terms and the Netherlands at 79 g/km (**Fig. 3-3**).

In 2021, manufacturers were required to meet an average CO₂ target of 95 g/km, with the individual targets dependent on the average vehicle weight of a manufacturer's fleet. At a brand level, Tesla (0 g/km) had the lowest fleet average CO₂ emission levels of brands sold in the EU in 2021. On the other end of the spectrum, Mercedes-Benz (108 g/km, in NEDC-terms) had one of the highest emission levels (**Fig. 3-4**).

While average CO₂ emission levels for new cars, according to the official test procedure, have decreased by about 42% since 2001, vehicle weight has increased by 17% and engine power has increased by 38% (**Fig. 3-6**).

EU
China
USA

Data sources: European Environmental Agency (EEA), Environmental Protection Agency (EPA), China Automotive Technology & Research Center (CATARC), EV100, ZEDATA

Between 2012 and 2020, the new car fleet in China gained significantly in weight, size, and power. An average new car in China is now heavier, bigger and has more engine power than its European counterpart, but still much lighter, less powerful and slightly smaller than an average new car in the US. CO₂ emission levels for new cars in Europe dropped by about 20%, whereas the decrease was only about 15% in the US and 10% in China. The average new car in the US emits about 70% more CO₂ than in Europe, in China it is about 30% more.

The share of diesel cars sold in the EU dropped considerably from 44% in 2017 to 23% in 2021. In France, where the diesel share was previously well above the EU average, it dropped from a peak of 77% in 2008 to 25% in 2021. In the Netherlands, the share of diesel cars fell to a level as low as 1% (**Fig. 4-1**). Mercedes and BMW were among the brands with the highest diesel penetration, each with a share of about 42% (**Fig. 4-6**).

The total market share of HEVs was 7% in 2021. Sales of HEVs were particularly strong in Finland, where they reached a 15% share in 2021, and were also relatively popular in Sweden (8%), Spain (10%), and the Netherlands (9%) (**Fig. 4-2**). Nearly 72% of all new vehicles manufactured by Toyota which are sold in the EU are hybrid electric (**Fig. 4-7**).

BEVs accounted for 9% of all new car sales in 2021, and PHEVs made up another 9%. PHEVs were particularly successful in Sweden, where the share rose from 7% in 2019 to 26% in 2021, and for the Volvo brand (41% in 2021) (**Fig. 4-3**, **Fig. 4-8**). BEVs reached the highest market share in the Netherlands (20%) and for the Nissan brand (15%) (**Fig. 4-4**, **Fig. 4-9**).

The average engine power of new passenger cars in the EU slightly decreased to a level of 102 kW in 2021, which is still 38% more than in 2001. Vehicles in Sweden and Germany, with average engine power values of 136 kW and 116 kW, respectively, are equipped with significantly more powerful engines than the EU average. Conversely, the average engine power of new cars in Italy was 85 kW in 2021 (**Fig. 4-14**).

In 2021, the average mass of new cars in the EU and the UK was, at 1,481 kg. The Swedish and German new car fleets, with average mass values of 1,709 kg and 1,577 kg, respectively, are also significantly heavier than the EU average. In contrast, customers in France opted for significantly lighter cars, with an average weight of 1,393 kg (**Fig. 4-16**).

5 ON-ROAD & OTHER EMISSIONS

Real-world CO₂ emission gap for plug-in hybrid versus conventional combustion engine cars in Europe

Plug-in hybrid cars type-approved according to the new WLTP emit on average about three times more CO₂ in real-world driving if they are registered by a private owner. Those registered as company cars on average emit five times the emissions estimated by the official test procedure. In comparison, the average combustion engine car exhibits a real-world gap of "only" around 15% for CO₂ in WLTP. From 2025 onwards, the so-called utility factor for plug-in hybrids will be revised, thereby leading to more realistic CO₂ emission values reported to consumers and authorities.

*Sample size n = 8,559

European Environmental Agency (EEA)

Since September 2014, Euro 6 emission limits have applied to new-vehicle type-approvals, and since September 2015, they have been mandatory for all new-vehicle sales (**Tab. 5-1**). The RDE on-road test procedure, introduced in two steps over a multi-year period beginning in September 2017, applies not-to-exceed (NTE) emission limits for NO_x and particulates (**Tab. 5-2**). During the first RDE stage, which corresponds to the Euro 6d-temp standard, temporary NTE limits were applied, while the final, more stringent limits are mandatory for all new-vehicle type-approvals since the phase-in of the second stage (Euro 6d) in January 2020. The Euro 6e regulation will take effect from September 2023 onwards. The conformity factor will be replaced by a 'PEMS margin' at a level of 1.1 for NO_x emissions and 1.34 for PN emissions (**Tab. 5-3**).

Tab. 5-1

EU emission limits for gasoline and diesel passenger cars

<https://transportpolicy.net>

EU emission limits for gasoline passenger cars (in g/km)

	Effective date*	CO	HC	NMHC	NO _x	HC+NO _x	PM	PN
Euro 3	Jan 2000	2.30	0.20	-	0.15	-	-	-
Euro 4	Jan 2005	1.00	0.10	-	0.08	-	-	-
Euro 5	Sep 2009	1.00	0.10	0.068	0.06	-	0.0050	-
Euro 6	Sep 2014	1.00	0.10	0.068	0.06	-	0.0050	6.0x10 ¹¹ **

EU emission limits for diesel passenger cars (in g/km)

	Effective date*	CO	HC	NMHC	NO _x	HC+NO _x	PM	PN
Euro 3	Jan 2000	0.64	-	-	0.50	0.56	0.0500	-
Euro 4	Jan 2005	0.50	-	-	0.25	0.30	0.0250	-
Euro 5	Sep 2009	0.50	-	-	0.18	0.23	0.0050	-
Euro 6	Sep 2014	0.50	-	-	0.08	0.17	0.0050	6.0x10 ¹¹ **

*For new vehicle types

**6.0x10¹¹ within first three years from Euro 6 effective dates.
Applies only to diesel and direct-injection gasoline cars.

Emission limits for light commercial (N1) vehicles class I are identical to passenger car limits listed in Tab. 5-1. N1 class II and N1 class III emission limits are not listed here.

All emission levels as tested in the New European Drive Cycle (NEDC). Emissions levels in real-world driving may differ from the test cycle values. **CO**: Carbon monoxide;
HC: Hydrocarbon; **NMHC**: Nonmethane hydrocarbon; **NO_x**: Nitrogen oxides;
HC+NO_x: Hydrocarbon and nitrogen oxides; **PM**: Particulate matter;
PN: Particulate number

Tab. 5-2

RDE timeline and conformity factors

Vehicle class	Implementation of the Real Driving Emissions (RDE) on-road test procedure		
	Euro 6d-TEMP	Euro 6d	
Passenger cars (M1) and small light commercial vehicles (N1 CL 1)	New types All vehicles	Sep 1 st 2017 Sep 1 st 2019 Sep 1 st 2018 Sep 1 st 2020	Jan 1 st 2020 Jan 1 st 2021 Jan 1 st 2021 Jan 1 st 2022
Other light commercial vehicles (N1 CL 2, 3 and N2)	New types All vehicles		

Not-to-exceed (NTE) emission limits of an RDE test result for the entire trip and the urban part alone

$$\text{NTE pollutant} = \text{CF pollutant} \times \text{EURO 6 pollutant limit}$$

Conformity Factor (CF)

Pollutant	Mass of oxides of nitrogen (NO _x)	Number of particles (PN)	Mass of carbon monoxide (CO)
Temporary CF Euro 6d-TEMP	2.1	1 + margin PN, with margin = 0.5	no on-road limit/ only measured
Final CF Euro 6d	1 + margin, with margin = 0.43	1 + margin PN, with margin = 0.5	no on-road limit/ only measured

Tab. 5-3

Timeline for introduction of Euro 6e emission standard

Implementation of the Euro 6e standard for new vehicles

		Euro 6e	Euro 6e-bis	Euro 6e-bis-FCM
Applies to all category M1, N1 and N2 vehicles covered by the light-duty vehicle regulation	New type approvals	1.9.2023	1.1.2025	1.1.2027
Applies to all category M1, N1 and N2 vehicles covered by the light-duty vehicle regulation	New vehicles	1.9.2024	1.1.2026	1.1.2028

Remarks on data sources

The basis for the statistics shown in this report is a database compiled by the ICCT. It includes technical information, emission levels, and registration volumes at a vehicle variant level. Sources of information include data obtained by the European Environmental Agency (EEA) on behalf of the European Commission, the German Kraftfahrt-bundesamt (KBA), the Netherlands Vehicle Authority (RDW), the United Kingdom Vehicle Certification Agency (VCA), Allgemeiner Deutscher Automobil-Club (ADAC), Automobil Revue, Dataforce, IHS Markit, km77.com, vehicle manufacturers and importers associations, and information provided directly by manufacturers and suppliers. Data included in this publication are aggregated to a great extent and are only intended to illustrate high-level trends. It is not to be considered official data. Due to the introduction of the new WLTP test procedure, NEDC CO₂ values are not available for all new passenger car registrations in the EU for all years. Figures shown make use of available NEDC and WLTP-based NEDC CO₂ values and may deviate from other publications.
